Files	Migration Plan	Suggested Tech	Database Suggestion	Note
example/src/ config.js	Create a new config.js file in Node.js to replace the existing config.php file. Update any references to the config.php file in the codebase to point to the new config.js file.	You can use the 'dotenv' library in Node.js to manage environment variables and configuration settings.	For a modern database solution, you can consider using an ORM like Sequelize or TypeORM in Node.js to interact with a relational database. This will help in managing database schema and queries more efficiently.	When migrating from PHP to Node.js, make sure to pay attention to differences in syntax, asynchronous nature of Node.js, and handling of dependencies. Also, consider using ES6 features like Promises and async/await for better code readability and maintainability.
example/src/ PaymentService.php example/src/ UserController.php example/src/ User.php	1. Refactor the PHP files into Node.js modules, keeping the functionality intact. Use ES6 syntax for classes and modules in Node.js. Create separate modules for User, PaymentService, and UserController. Use import/export statements to handle dependencies between modules.	For handling database operations in Node.js, you can use libraries like Sequelize or TypeORM for ORM functionality. These libraries provide an easy way to interact with relational databases in Node.js.	For the database schema, you can migrate the existing SQL schema to a relational database like PostgreSQL or MySQL. Use Sequelize or TypeORM to define models and interact with the database in a Node.js environment.	When converting from PHP to Node.js, pay attention to differences in syntax and asynchronous nature of Node.js. Make sure to handle asynchronous operations properly using promises or async/await. Also, consider any PHP-specific functionalities that may need to be replaced with equivalent Node.js functionalities.
example\\src\\ \\schema.sql	1. Convert the SQL schema to a Node.js module that exports the schema as an	You can use Sequelize, a Node.js ORM, to define and	For a modern database solution, consider using a relational database	When converting from PHP to Node.js, keep in mind the differences in syntax and asynchronous nature of Node.js. Make sure to handle database queries asynchronously using
