

Migration Map

Generated at: 7/15/2025, 6:56:43 AM

File	Migration Type	Suggested Tech	Note
example\src\config.php	Rewrite	Python dictionary config	In PHP, configuration files are often written as arrays. In Python, a similar approach can be taken by using dictionaries to store configuration settings.
example\src\PaymentService.php	Rewrite	Django	Since PHP and Python have different syntax and frameworks, it would be best to rewrite the PaymentService.php file in Python using a framework like Django for web development.
example\src\schema.sql	Special review required	SQLAlchemy (Python ORM)	Since the source system is written in PHP and the target system must be in Python, a special review is required to ensure compatibility and proper migration of the SQL schema. Consider using SQLAlchemy, a Python SQL toolkit and Object-Relational Mapping (ORM) library, to interact with the database in the target system.
example\src\User.php	Rewrite	Django	Since the source system is written in PHP and the target system must be in Python, a rewrite of the User.php file using Django, a popular Python web framework, would be necessary for this migration.
example\src\UserController.php	Rewrite	Django	Since PHP and Python are different languages, a rewrite of the UserController.php file will be necessary. Consider using Django, a popular Python web framework, for building the equivalent functionality in Python.
