

Migration Map

Generated at: 7/14/2025, 9:49:47 PM

File	Migration Type	Suggested Tech	Note
example\src\config.php	Rewrite	Node.js JSON config	In PHP, configuration files are commonly written in PHP arrays. To migrate to Node.js, rewrite the configuration file in JSON format for easier compatibility and readability.
example\src\PaymentService.php	Rewrite	Express.js	Since PHP and Node.js have different syntax and paradigms, it would be best to rewrite the PaymentService.php file in Node.js using Express.js framework for handling HTTP requests.
example\src\schema.sql	Special review required	NoSQL (e.g., MongoDB)	Since the source system is written in php and the target system must be in nodejs, a special review is required to ensure compatibility and proper migration of the SQL schema to a NoSQL database like MongoDB in the nodejs environment.
example\src\User.php	Rewrite	Express.js	Since PHP is a server-side language and Node.js is also server-side, you will need to rewrite the PHP code in Node.js using Express.js framework to handle routing and server logic.
example\src\UserController.php	Rewrite	Express.js	Node.js uses Express.js as a popular web framework for building APIs, which can be a good equivalent to PHP for handling HTTP requests and responses.
